

# BioAg Digest It Treatment & Storage.

## Treatment

- An initial charge to the slurry lagoon or tank, 20 ltrs (1 drum) Digest-it per 100,000 gallons of slurry. Dilute with water and distribute as evenly as possible.
- Digest-it should be used on the basis of 1 litre per cow per year, i.e. for 150 cow herd, 150 litres Digest-it would be used over a 30 week winter period (5 litres per week). This could be added as 1 litre per day Monday to Friday, or 2.5 litres twice a week, or 5 litres once a week, whichever fits in best with farm practice. Digest-it should be diluted with water and poured under the slats or at the point the slurry is scraped into the lagoon, whichever is appropriate.

## Storage and Handling

- Store containers out of sunlight and below 30°C.
